ABSTRACT

With the wide application of digital images and the development and popularization of Internet technology, the security protection and copyright protection of digital images have become an urgent problem to be solved. Blind digital watermarking technology has become an effective means of digital copyright protection because of its invisibility and not easy to be destroyed. DWT domain digital watermarking algorithm based on Arnold scrambling and ZUC encryption can be widely used as a combined innovative algorithm, and has received extensive research and attention.

This paper proposes a digital watermarking algorithm in the DWT domain, utilizing Arnold scrambling and ZUC encryption to address the security issues in current digital images. The algorithm enhances the security of digital watermarking by incorporating these techniques, while embedding the digital watermark in the DWT domain to achieve copyright protection and security for digital images, thereby improving the robustness of the digital watermarking.

This paper first introduces the research background and development status of digital watermarking technology, focusing on the principles of DWT domain digital watermarking technology and Arnold scrambling and ZUC encryption technology and their application in digital watermarking. Then, the principle and implementation steps of DWT domain digital watermarking algorithm based on Arnold scrambling and ZUC encryption proposed in this paper are elaborated. This algorithm embeds the digital watermark into the low-frequency coefficient by using discrete wavelet transform, and ensures the security of the digital watermark through Arnold scrambling and ZUC encryption. Finally, through experimental verification and comparative analysis of multiple test images, the effectiveness and feasibility of the algorithm are verified, and the experimental results are analyzed to verify the safety and robustness of the overall algorithm system.
